Definitions:

A mixer is a device capable of three states of mixing. Two states of mixing form the basic operation: dispersed phase mixing and medium mixing. The third state, mixing by displacement, involves the ability to mix or separate substances that were in different positions or states.

After:

The mixer is a device capable of three states of mixing - dispersed phase mixing and medium mixing.

- Recovery from the harmful effects may vary following different circumstances and strategies. This document outlines potential strategies and resources that are either already utilized or could be developed in the future. For more information, refer to the latest edition of the Strategic Plan (SPP). The OECD Development Strategy is the guiding document for ensuring the effective implementation of policies. The framework of the SPP is a safety net, with assistance to the left side, ensuring proportional utility to the right. The framework is a reference tool for understanding and analyzing various aspects of the framework and strategic plan. It should be noted that the data presented here is for demonstration purposes only and is not intended to reflect current or future conditions.
